

# Real Time Water Quality Report

## Humber River at Humber Village

Deployment Period  
2025-09-25 to 2025-12-18

Government of Newfoundland & Labrador  
Department of Environment, Conservation & Climate Change  
Water Resources Management Division

## General

The following report is a summary of water quality monitoring data collected in real-time at the Humber River at Humber Village Bridge station from September 25 to December 18, 2025.

**Figure 1: Humber River at Humber Village Bridge Real Time Water Quality station location**

This station operates year-round as part of the Provincial Real Time Water Quality (RTWQ) monitoring network. A multi-parameter sonde is deployed in the river and records parameters of interest including: temperature (°C); pH; dissolved oxygen (mg/L); specific conductivity (µS/cm); total dissolved solids (g/L) and turbidity (NTU). Staff at the Department of Environment and Climate Change (Water Resources Management Division-WRMD) monitor the data for potential environmental impacts. The sonde undergoes routine maintenance/calibration on a regular basis, after which the instrument is redeployed, generally within 24 hours.

## Quality Assurance/Quality Control (QA/QC)

A routine QA/QC performance test is administered on the instrument at the beginning and end of each deployment period. The methodology of this protocol can be found in Appendix A.

The purpose is to determine the accuracy of the instrument's sensors by cross-examining its initial readings against a control sonde which is deployed at the same time to compare parameters. Depending on these readings, the sensors of each parameter receive a qualitative rank (Appendix A) based on whether readings fall within a specified threshold. This will further ensure the integrity of the data's accuracy, so that the monitoring station delivers reliable results.

With the exception of water quantity data (i.e. stage), all other data used in the preparation of graphs and subsequent discussion below adhere to the stringent QA/QC protocol. The stage data is raw data that is transmitted via satellite and published on WRMD's webpage. It has not been corrected for backwater effect. Water Survey of Canada is responsible for QA/QC of water quantity data. Corrected data can be obtained upon request.

**Table 1: QA/QC water quality performance results for the beginning and end of deployment period.**

Station	Date	Action	Comparison Ranking				
			Temperature	pH	Conductivity	Dissolved Oxygen	Turbidity
Humber River at Humber Village Bridge	Sept 25	Deployment	Excellent	Good	Excellent	Excellent	Excellent
	Dec 18	Removal	Excellent	Excellent	Excellent	Excellent	Excellent

All performance rankings at deployment and removal ranked 'good' or 'excellent'.

### Deployment Notes

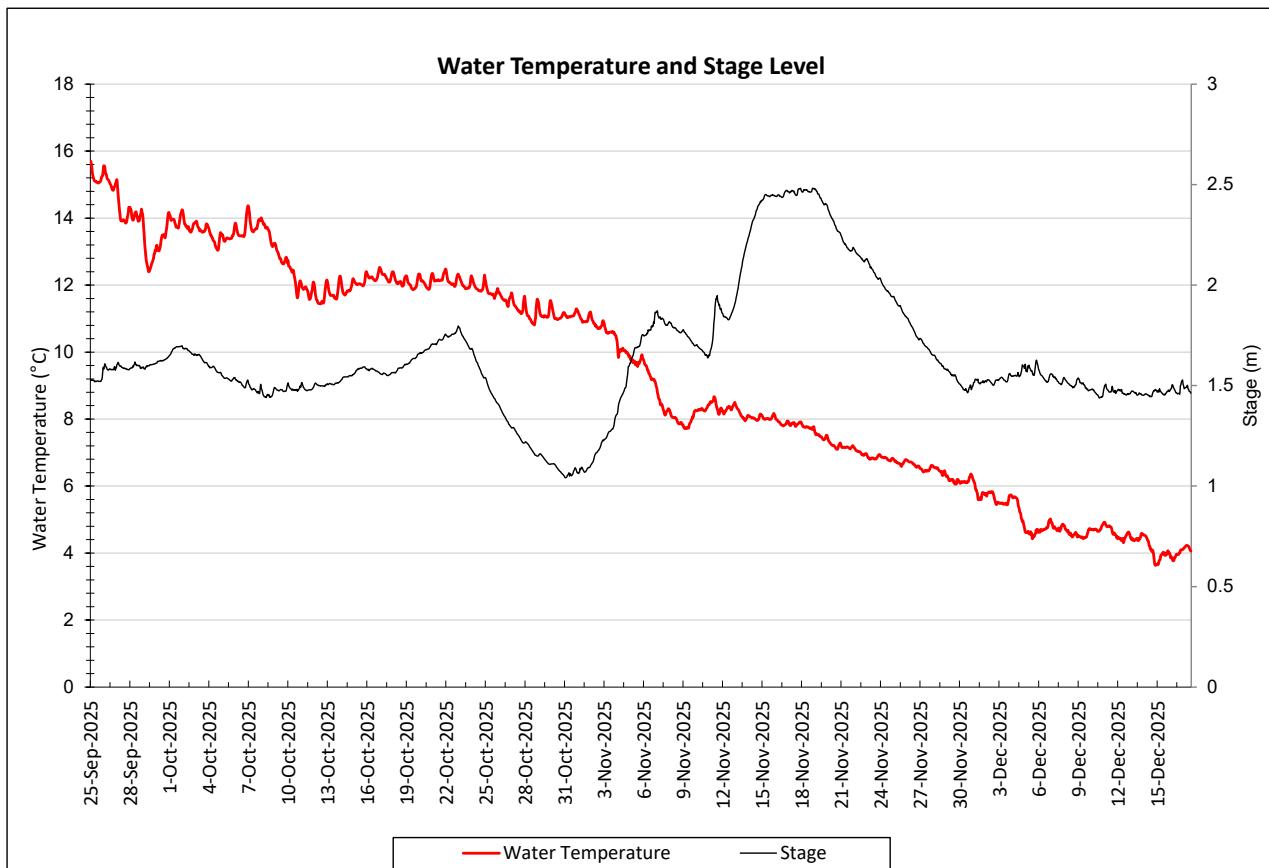

This deployment took place over the course of 83 days (September 25 to December 18, 2025), during which there were no significant interruptions or data loss.

### Data Interpretation

The following interpretations for the Humber River stations will cover the following six parameters: Stage (m); (2) Temperature (°C); (3) pH; (4) Specific Conductivity (µS/cm); (5) Dissolved Oxygen (mg/L); (6) Turbidity (NTU).

## Temperature

- Throughout the deployment period, water temperatures ranged between 3.64 °C and 15.71 °C, with an average temperature of 9.39 °C.
- Water temperatures fell steadily into Fall, in-line with seasonal trends.
- Water temperature values display a natural diurnal pattern with temperatures increasing during the day and decreasing overnight. The magnitude of variation was influenced by daily air temperature fluctuations as well as precipitation events.

**Figure 2: Water Temperature and Stage at Humber River at Humber Village Bridge**

## pH

- pH ranged between 6.77 and 7.17 during the deployment period, with an average of 7.01 pH units.
- The pH data was generally consistent during the deployment, but did appear to be affected by rising water levels on a few occasions (September 29<sup>th</sup> and November 9<sup>th</sup>) resulting in temporary decreases. A slight increasing trend is observed at the end of deployment.
- Throughout the deployment, pH remained within the acceptable range for the protection of aquatic life as outlined by the Canadian Council of Ministers of the Environment (CCME) (2007).

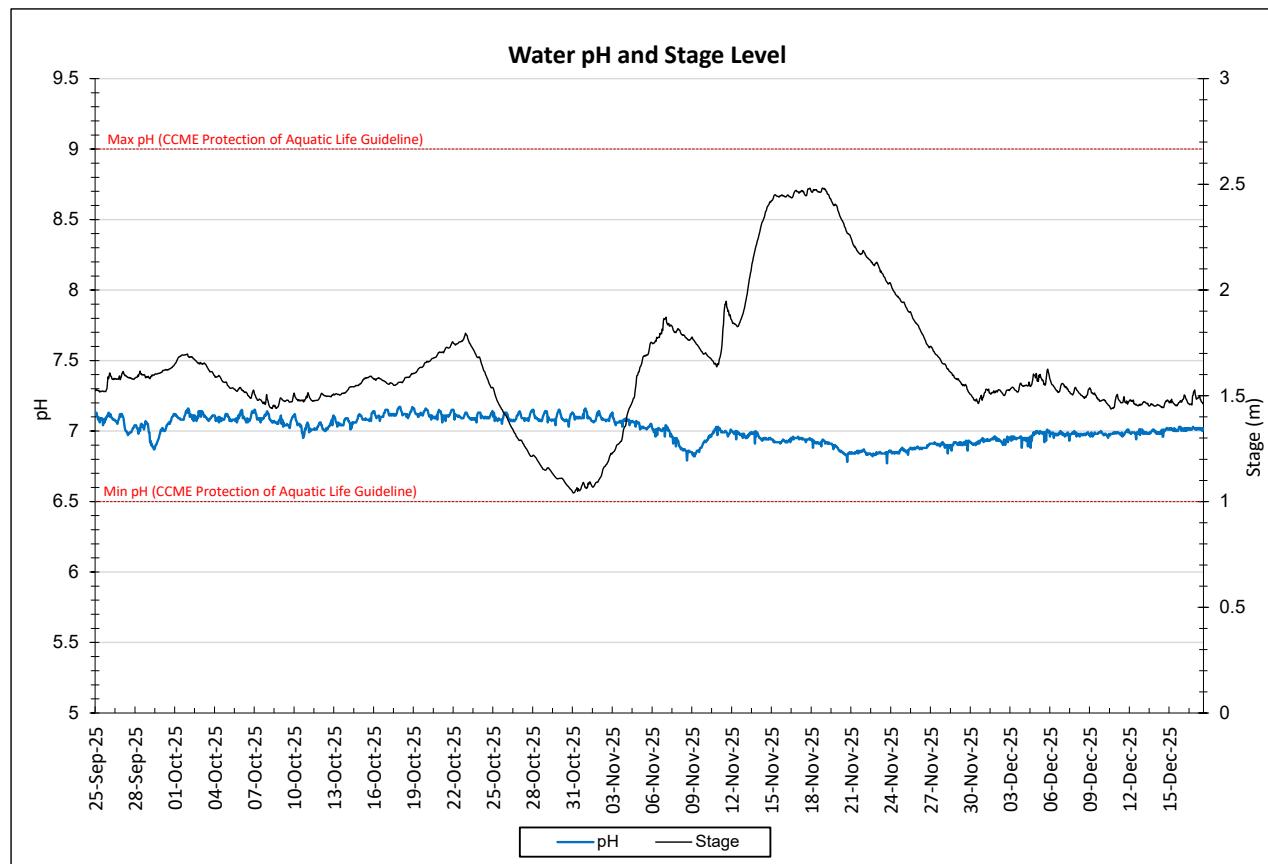

Figure 3: pH values recorded at Humber River at Humber Village Bridge

## Specific Conductivity

- Throughout the deployment period, specific conductivity ranged between 41.4  $\mu\text{S}/\text{cm}$  and 44.8  $\mu\text{S}/\text{cm}$ , with an average of 43.1  $\mu\text{S}/\text{cm}$ .
- With such a small range of values, specific conductivity was very stable during this deployment, influenced occasionally by stage fluctuations such as on November 6<sup>th</sup> and 12<sup>th</sup> when slight increases in conductivity occurred just after stage increases. This indicates the additional water likely suspended sediment into the water column.

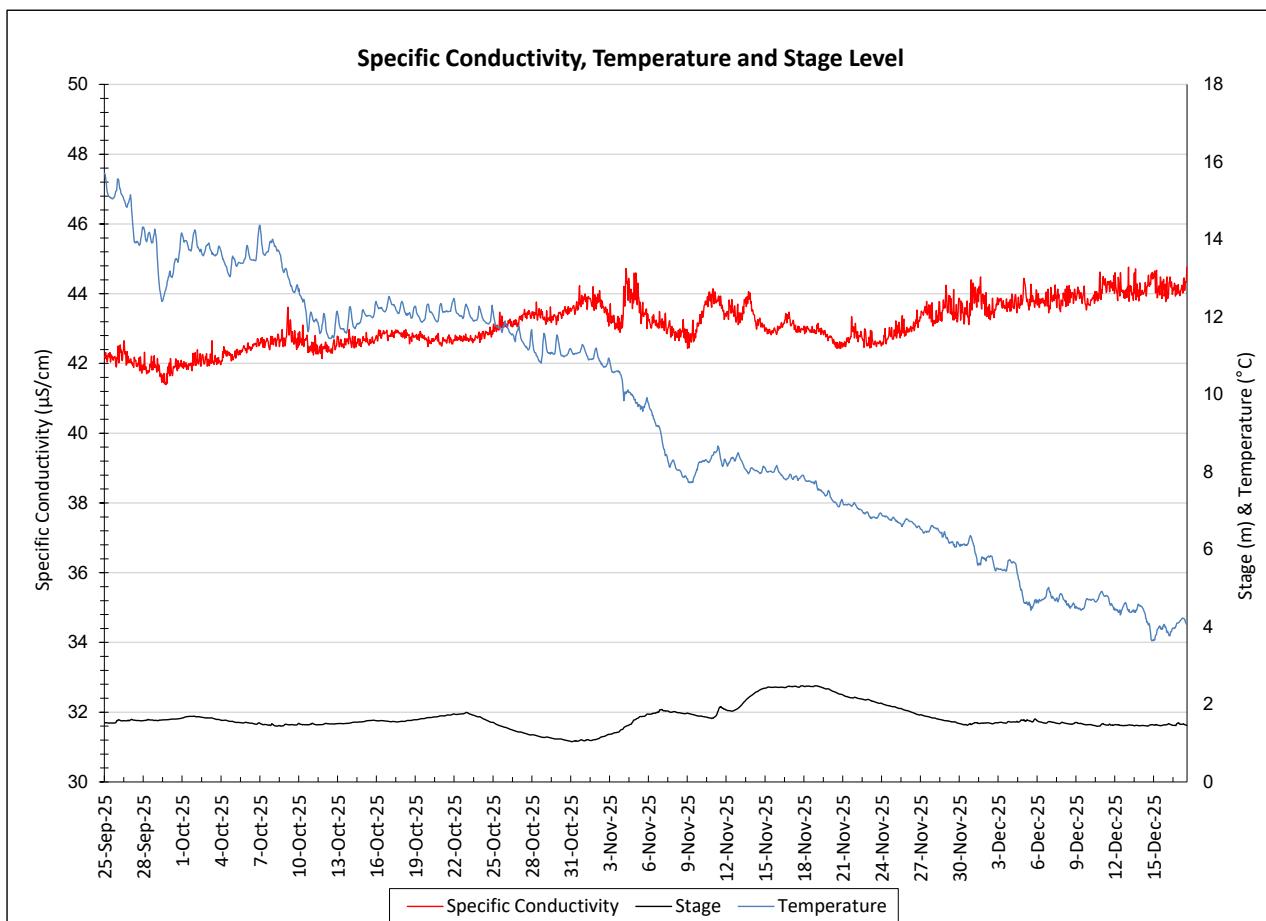

Figure 4: Specific Conductivity at Humber River at Humber Village Bridge

## Dissolved Oxygen

- During the deployment period, dissolved oxygen concentrations ranged from 9.60 mg/L to 12.39 mg/L, with an average of 10.96 mg/L. Dissolved oxygen percent-saturation ranged from 93.1% to 99.1%, with an average of 95.2%.
- Dissolved oxygen is inversely related to water temperature: oxygen levels increase in lower water temperatures and decrease in higher water temperatures.
- Dissolved oxygen levels gradually increased across the deployment, which is expected as water temperatures cooled steadily into the Fall. This is a natural, seasonal cycle.
- All values remained above the threshold CCME guidelines for the protection of early and other life stages throughout deployment(CCME, 2007).

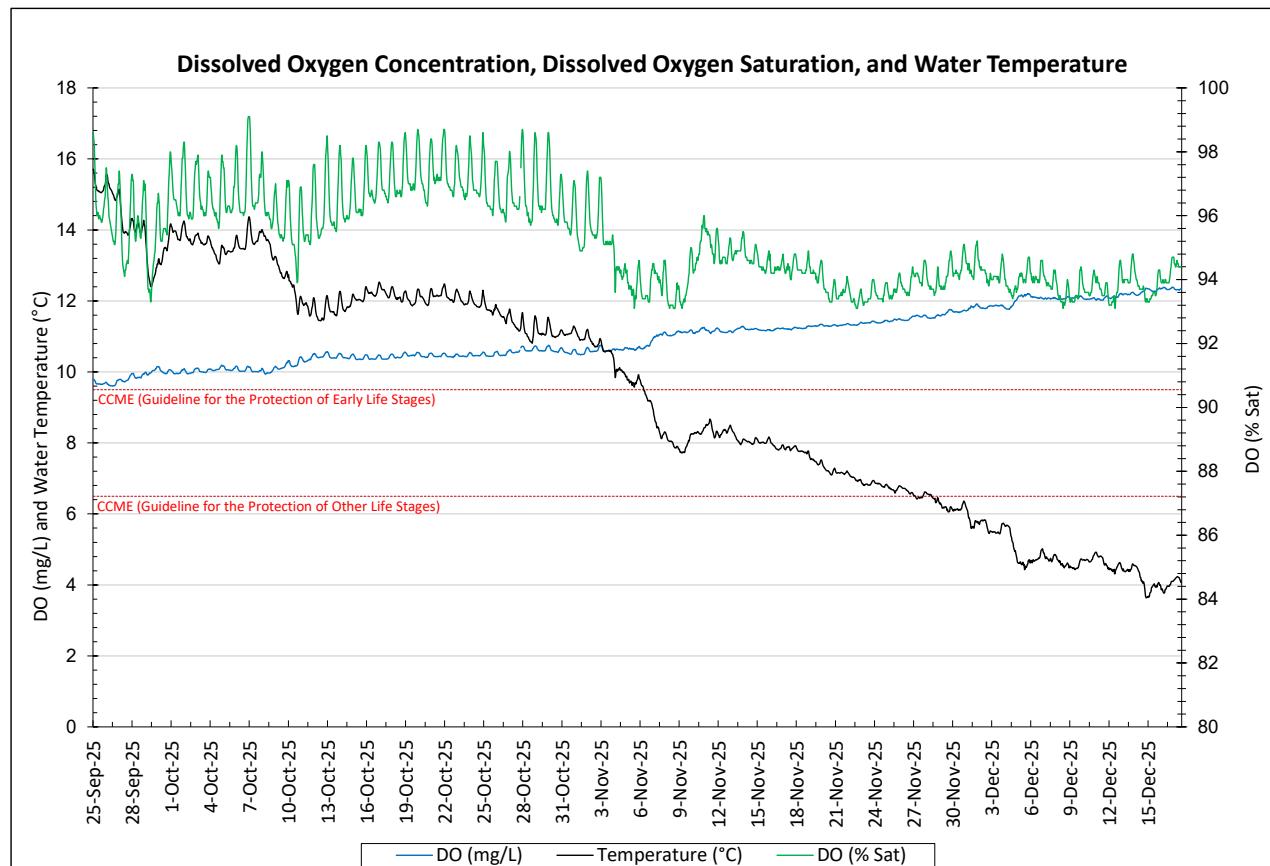

Figure 5: DO (mg/L & % saturation) with Water Temperature (°C) at Humber River at Humber Village Bridge

## Turbidity & Stage

- Throughout the deployment period, turbidity ranged from 0.1 NTU to 9.0 NTU, with an average turbidity of 0.3 NTU.
- Turbidity was relatively stable with minor, natural background fluctuations. Short-term increases during periods of rising stage levels were observed in November.
- Stage ranged from 1.04 m to 2.48 m, averaging at 1.65 m and with a range of 1.44m. Stage experienced some significant fluctuations during this deployment period but was stable as the deployment ended.

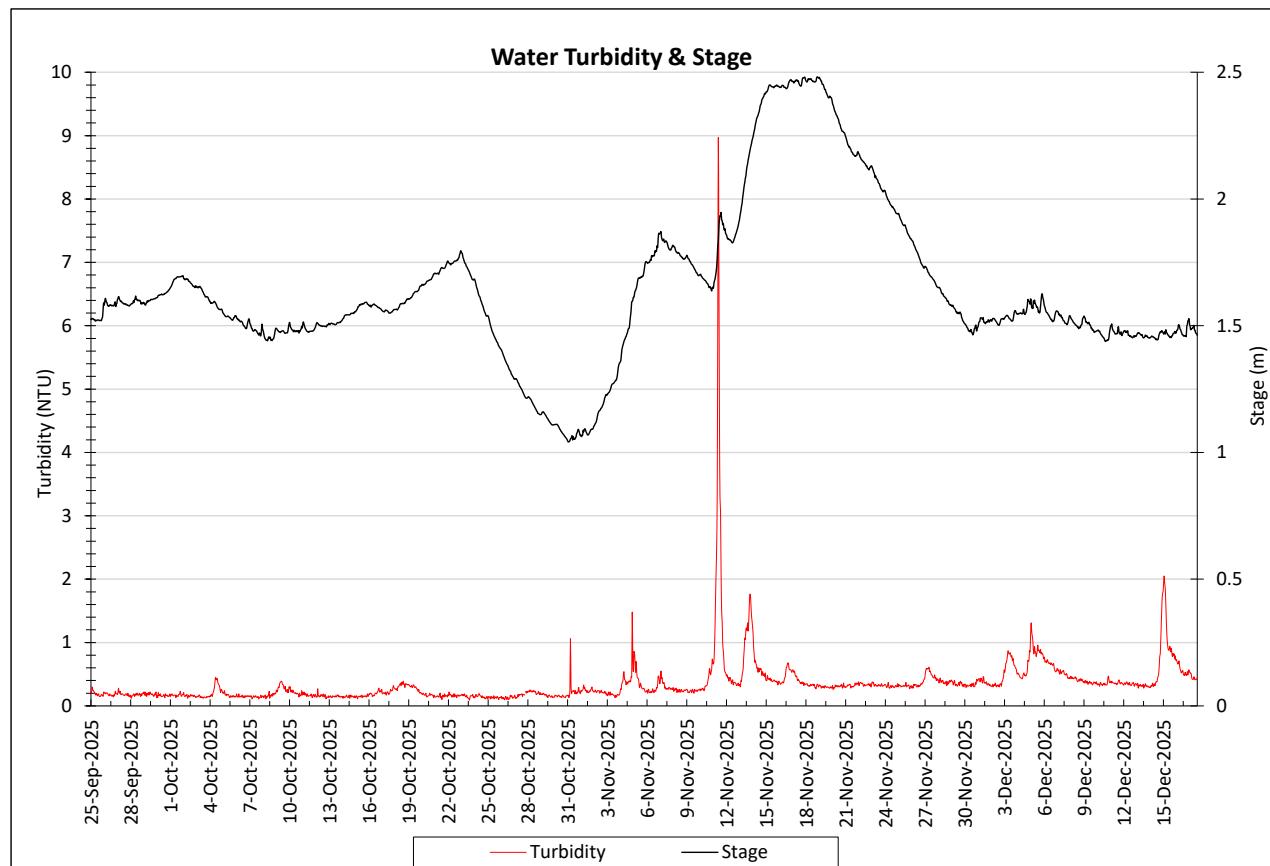

Figure 6: Turbidity & Stage at Humber River at Humber Village Bridge

## Conclusions

- This deployment report summarizes the real time water quality and quantity monitoring data recorded at the Humber River at Humber Village Bridge station over a period of 83 days. No unusual events or data anomalies were evident. Some parameters were influenced by increased stage as the result of precipitation events particularly around November 6<sup>th</sup> and 12<sup>th</sup>.
- All parameters displayed trends typical for this waterbody at this time of year. pH and dissolved oxygen values were within the recommended CCME guidelines for the Protection of Aquatic Life throughout deployment.

## APPENDIX A

### Quality Assurance / Quality Control Procedures

As part of the Quality Assurance / Quality Control (QA/QC) protocol, the performance of a station's water quality instrument (i.e., field sonde) is rated at the beginning and end of its deployment period. The procedure is based on the approach used by the United States Geological Survey (Wagner *et al.* 2006)<sup>1</sup>.

At the beginning of the deployment period, a fully cleaned and calibrated QA/QC water quality instrument (i.e., QA/QC sonde) is placed *in-situ* with the fully cleaned and calibrated field sonde. After sonde readings have stabilized, water quality parameters, as measured by both sondes, are recorded. Field sonde performance for all parameters is rated based on differences recorded by the field sonde and QA/QC sonde. If the readings from both sondes are in close agreement, the QA/QC sonde can be removed from the water. If the readings are not in close agreement, there will be attempts to reconcile the problem on site (e.g., removing air bubbles from sensors, etc.). If no fix is made, the field sonde may be removed for recalibration.

At the end of the deployment period, a fully cleaned and calibrated QA/QC sonde is once again deployed *in-situ* with the field sonde. After Sonde readings have stabilized, water quality parameters, are measured by both sondes and recorded. Field sonde performance for all parameters is rated based on differences recorded by the field sonde and QA/QC sonde.

Performance ratings are based on differences listed in the table below:

Parameter	Rating				
	Excellent	Good	Fair	Marginal	Poor
Temperature (°C)	$\leq \pm 0.2$	$> \pm 0.2$ to 0.5	$> \pm 0.5$ to 0.8	$> \pm 0.8$ to 1	$> \pm 1$
pH (unit)	$\leq \pm 0.2$	$> \pm 0.2$ to 0.5	$> \pm 0.5$ to 0.8	$> \pm 0.8$ to 1	$> \pm 1$
Sp. Conductance ( $\mu\text{S}/\text{cm}$ )	$\leq \pm 3$	$> \pm 3$ to 10	$> \pm 10$ to 15	$> \pm 15$ to 20	$> \pm 20$
Sp. Conductance $> 35 \mu\text{S}/\text{cm}$ (%)	$\leq \pm 3$	$> \pm 3$ to 10	$> \pm 10$ to 15	$> \pm 15$ to 20	$> \pm 20$
Dissolved Oxygen (mg/l) (% Sat)	$\leq \pm 0.3$	$> \pm 0.3$ to 0.5	$> \pm 0.5$ to 0.8	$> \pm 0.8$ to 1	$> \pm 1$
Turbidity $< 40$ NTU (NTU)	$\leq \pm 2$	$> \pm 2$ to 5	$> \pm 5$ to 8	$> \pm 8$ to 10	$> \pm 10$
Turbidity $> 40$ NTU (%)	$\leq \pm 5$	$> \pm 5$ to 10	$> \pm 10$ to 15	$> \pm 15$ to 20	$> \pm 20$
