

THE ISLAND OF NEWFOUNDLAND REPRESENTS AN EMERGING, UNDER-EXPLORED GOLD DISTRICT

- **First focused exploration for gold in early 1980's**
- **Previous production from epithermal (Au-Cu) and orogenic (Au-only) deposits, and as byproduct of VMS operations**
- **Current and recent production from orogenic and VMS deposits; advanced projects targeting similar styles of mineralization**

- **Advanced and greenfield exploration programs for high- and low-sulphidation epithermal deposits; other projects targeting bulk-tonnage, intrusion- and sediment-hosted deposits**
- **Recent discoveries have led to a surge of new exploration investment**
- **Properties are available for option or joint venture**
